TP5: Segmentation d'image

Table of Contents

1)	Seuillage	. 1
	Seuillage adaptatif	
3)	Ligne de partage des eaux	6
4)	Contours actifs	. 9
5)	Détection de cercles	14
6)	Pré- et Post-traitements	16

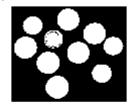

1) Seuillage

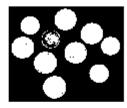

coins.png

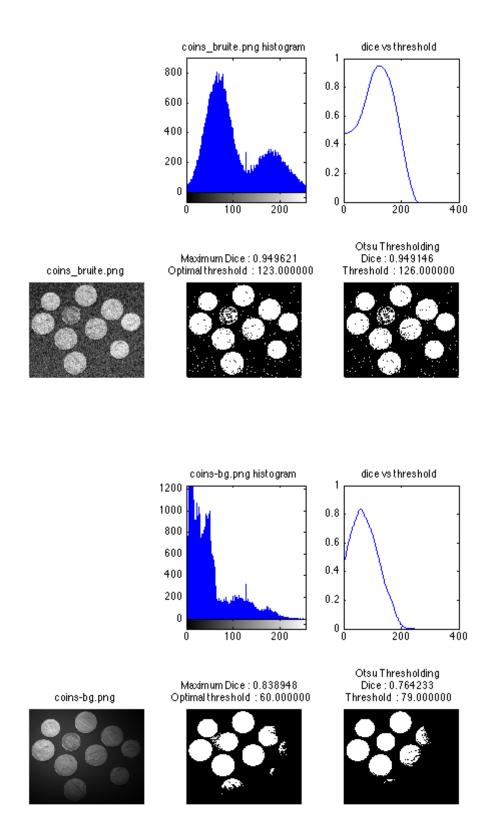

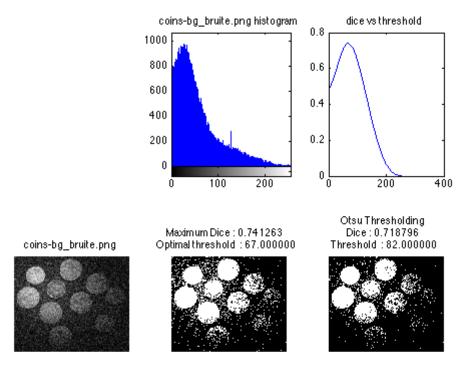

Maximum Dice : 0.989423 Optimal threshold : 105.000000

Otsu Thresholding Dice : 0.981009 Threshold : 126.000000

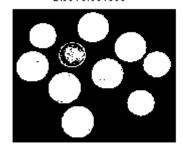

- · La méthode d'Otsu fonctionne relativement bien (résultat en général proche du seuil optimal)
- L'ajout un bruit gaussien tend à étaler l'histogramme de chacune des classes (car cela revient à convoluer l'histogramme par une gaussienne). Par conséquent, cela rend plus difficile la séparation des classes. Le seuillage est donc très sensible au bruit.
- L'ajout d'une variation d'illumination ne permet plus de séparer correctement les deux classes par un simple seuillage

2) Seuillage adaptatif

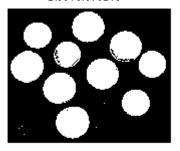

coins.png

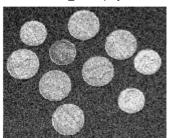

Otsu Thresholding Dice : 0.981009

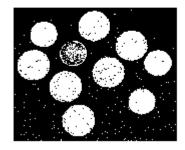

Adaptive Thresholding Dice : 0.976246

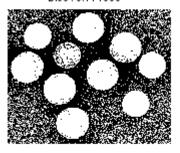

coins_bruite.png

Otsu Thresholding Dice : 0.949146

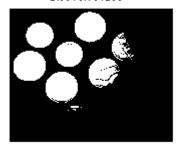

Adaptive Thresholding Dice: 0.774698

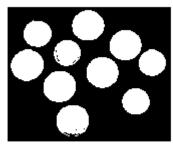

coins-bg.png

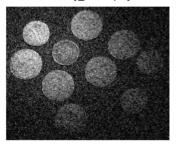

Otsu Thresholding Dice : 0.764233

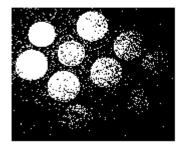

Adaptive Thresholding Dice : 0.986184

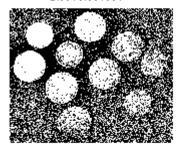

coins-bg_bruite.png

Otsu Thresholding Dice : 0.718796

Adaptive Thresholding Dice: 0.694901

- La méthode de seuillage adaptatif est efficace pour les images avec une variation d'illumation.
- La méthode de seuillage adaptatif reste néanmoins très sensible au bruit

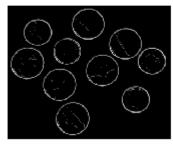

3) Ligne de partage des eaux

Ces résulats ont été obtenus en seuillant la norme du gradient

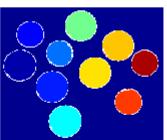

coins.png

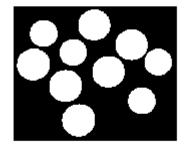

Norme du gradient

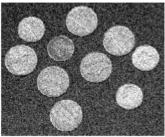

Watershed

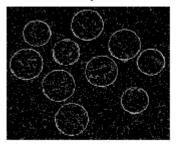

Binarisation Dice : 0.976137

coins_bruite.png

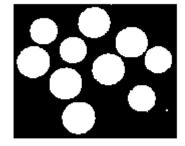

Norme du gradient

Watershed

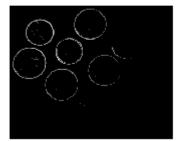

Binarisation Dice : 0.975128

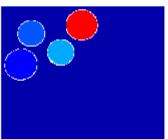

coins-bg.png

Norme du gradient

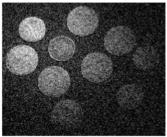

Watershed

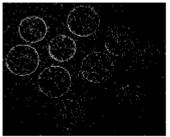

Binarisation Dide: 0.543612

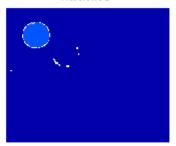

coins-bg_bruite.png

Norme du gradient

Watershed

Binarisation Dice : 0.153956

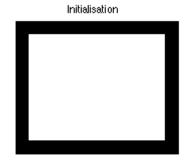

- Si on ne seuille pas la norme du gradient : beaucoup trop de régions segmentées (sur-segmentation).
- La qualité de la segmentation dépend grandement de la qualité de l'image de gradient.

4) Contours actifs

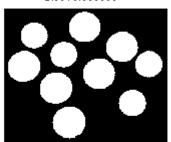

Résultats obtenus avec une boite englobante comme initialisation

coins.png

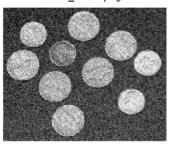

Active Contour (Chan-Vese) Dice: 0.996659

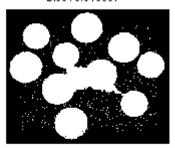

Active Contour (Edge) Dice: 0.745264

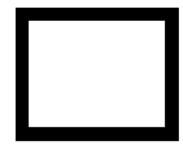

coins_bruite.png

Active Contour (Chan-Vese) Dice : 0.945907

Initialisation

Active Contour (Edge) Dice : 0.578028

coins-bg.png

Active Contour (Chan-Vese) Dice : 0.774883

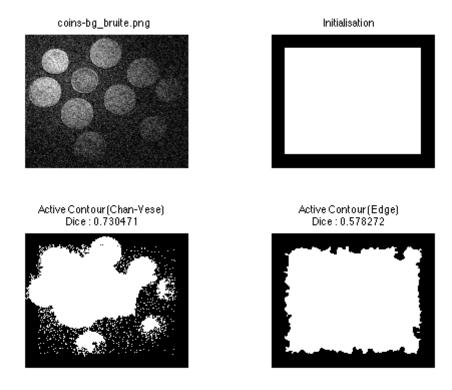

Initialisation

Active Contour (Edge) Dice : 0.748614

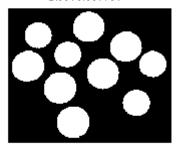

Résultats obtenus avec une initialisation très proche de la solution

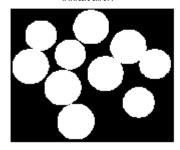

coins.png

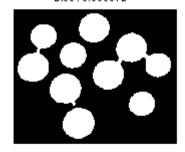

Active Contour (Chan-Vese) Dice : 0.997734

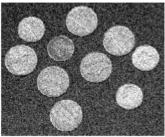

Initialisation

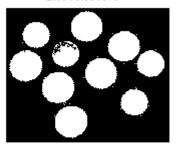

Active Contour (Edge) Dice : 0.958872

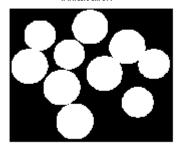

coins_bruite.png

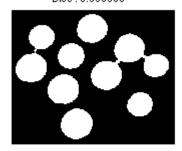

Active Contour (Chan-Vese) Dice : 0.984378

Initialisation

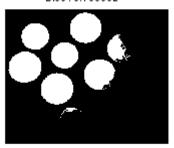

Active Contour (Edge) Dice : 0.950908

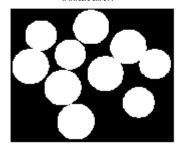

coins-bg.png

Active Contour (Chan-Vese) Dice : 0.783682

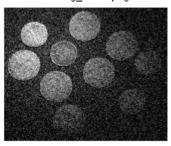

Initialisation

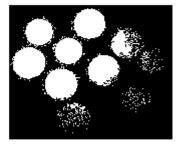

Active Contour (Edge) Dice : 0.882391

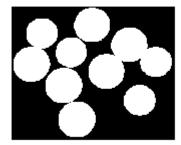

coins-bg_bruite.png

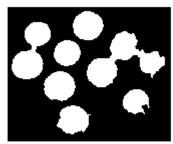

Active Contour (Chan-Vese) Dice : 0.805733

Initialisation

Active Contour (Edge) Dice : 0.934896

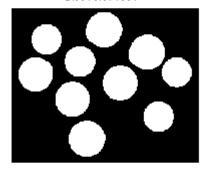

- La qualité du résultat des contours actifs dépend fortement de l'initialisation, notamment pour la méthode 'edge'.
- Néanmoins, la méthode 'edge' est plus robuste au bruit et aux variations d'illumination
- Importance du paramètre SMOOTHFACTOR qui définit le compromis entre attache aux données et régularité du contour (Attention, par défaut il est à 0 pour 'Chan-Vese' et à 1 pour 'edge')

5) Détection de cercles

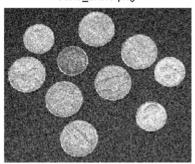

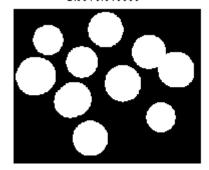

Hough Transform Dice: 0.971564

coins_bruite.png

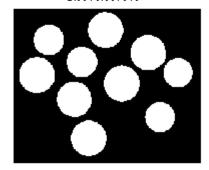

Hough Transform Dice: 0.940566

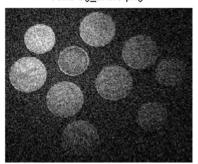

coins-bg.png

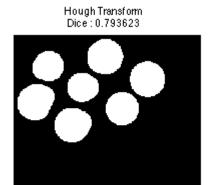

Hough Transform Dice: 0.967013

coins-bg_bruite.png

• La transformée de Hough est très robuste au bruit et au variation d'illumination grâce à l'a priori très fort sur la forme des objets recherchés.

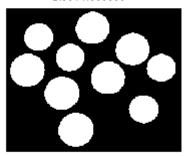

6) Pré- et Post-traitements

Exemple de résultats qu'il est possible d'obtenir sur chacune des images

coins.png

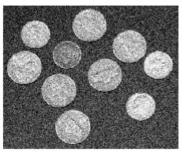

Dice: 1.000000

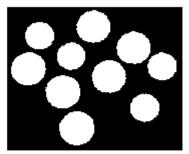

Erreur de segmentation

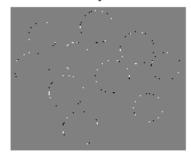

coins_bruite.png

Dice: 0.992620

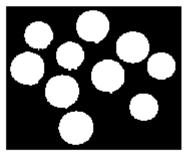

Erreur de segmentation

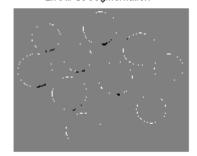

coins-bg.png

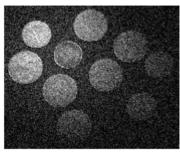

Dice: 0.986334

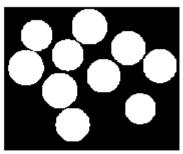

Erreur de segmentation

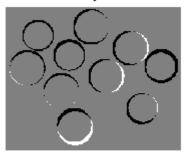

coins-bg_bruite.png

Dice: 0.898744

Erreur de segmentation
